Using local files in pgAdmin

When pgAdmin runs in a Docker container, its file browser shows the file system **from the container's perspective**. You can only see files and mounted volumes available inside the container. Folders on your own computer, such as *Downloads* or *Documents*, are not automatically visible.

To use a local file, such as a `.sql` file, open **Tools** → **Storage Manager**. This allows you to upload files from your computer to pgAdmin's storage. Once uploaded, you can select and use the file within pgAdmin, for example in the Query Tool.

For more information, see the official pgAdmin documentation on the Storage Manager.
